6 Hidden Cells ..................................................... 37

7 Controlling Notebook Execution .................................. 38
  7.1 Pre-Executing Notebooks .................................... 38
nbsphinx is a Sphinx¹ extension that provides a source parser for *.ipynb files. Custom Sphinx
directives are used to show Jupyter Notebook² code cells (and of course their results) in both HTML
and LaTeX output. Un-evaluated notebooks – i.e. notebooks without stored output cells – will be
automatically executed during the Sphinx build process.

Quick Start:

1. Install nbsphinx
2. Edit your conf.py and add 'nbsphinx' to extensions.
3. Edit your index.rst and add the names of your *.ipynb files to the toctree.
4. Run Sphinx!

Online documentation (and example of use): http://nbsphinx.readthedocs.io/

¹ https://www.sphinx-doc.org/
² https://jupyter.org/
1 Installation

Note that some packages may be out of date. You can always get the newest nbsphinx release from PyPI\(^3\) (using pip). If you want to try the latest development version, have a look at the section Contributing (page 53).

1.1 nbsphinx Packages

If you are using the conda package manager (e.g. with Anaconda\(^5\) for Linux/macOS/Windows), you can install nbsphinx from the conda-forge\(^6\) channel:

```
conda install -c conda-forge nbsphinx
```

If you are using Linux, there are packages available for many distributions.

\(^3\) [https://pypi.org/project/nbsphinx](https://pypi.org/project/nbsphinx)  
\(^4\) [https://anaconda.org/conda-forge/nbsphinx](https://anaconda.org/conda-forge/nbsphinx)

7 https://repology.org/project/python:nbsphinx/versions
On any platform, you can also install `nbsphinx` with `pip`, Python’s own package manager:

```
python3 -m pip install nbsphinx --user
```

If you want to install it system-wide for all users (assuming you have the necessary rights), just drop the `--user` flag.

To upgrade an existing `nbsphinx` installation to the newest release, use the `--upgrade` flag:

```
python3 -m pip install nbsphinx --upgrade --user
```

If you suddenly change your mind, you can un-install it with:

```
python3 -m pip uninstall nbsphinx
```

Depending on your Python installation, you may have to use `python` instead of `python3`.

### 1.2 nbsphinx Prerequisites

Some of the aforementioned packages will install some of these prerequisites automatically, some of the things may be already installed on your computer anyway.

#### 1.2.1 Python

Of course you’ll need Python, because both Sphinx and `nbsphinx` are implemented in Python. There are many ways to get Python. If you don’t know which one is best for you, you can try Anaconda⁹.

#### 1.2.2 Sphinx

You’ll need Sphinx¹⁰ as well, because `nbsphinx` is just a Sphinx extension and doesn’t do anything on its own.

If you use `conda`, you can get Sphinx from the conda-forge channel¹¹:

```
conda install -c conda-forge sphinx
```

Alternatively, you can install it with `pip` (see below):

```
python3 -m pip install Sphinx --user
```

---

⁸ https://pypi.org/project/nbsphinx
⁹ https://www.anaconda.com/distribution/
¹⁰ https://www.sphinx-doc.org/
¹¹ https://anaconda.org/conda-forge/sphinx
1.2.3 pip

Recent versions of Python already come with pip pre-installed. If you don’t have it, you can install it manually\textsuperscript{12}.

1.2.4 pandoc

The stand-alone program pandoc\textsuperscript{13} is used to convert Markdown content to something Sphinx can understand. You have to install this program separately, ideally with your package manager. If you are using conda, you can install pandoc from the conda-forge channel\textsuperscript{14}:

```
conda install -c conda-forge pandoc
```

If that doesn’t work out for you, have a look at pandoc’s installation instructions\textsuperscript{15}.

Note:
The use of pandoc in nbsphinx is temporary, but will likely stay that way for a long time, see issue \#36\textsuperscript{16}.

1.2.5 Pygments Lexer for Syntax Highlighting

To get proper syntax highlighting in code cells, you’ll need an appropriate Pygments lexer. This of course depends on the programming language of your Jupyter notebooks (more specifically, the pygments_lexer metadata of your notebooks).

For example, if you use Python in your notebooks, you’ll have to have the IPython package installed, e.g. with

```
conda install -c conda-forge ipython
```

or

```
python3 -m pip install IPython --user
```

Note:
If you are using Anaconda with the default channel and syntax highlighting in code cells doesn’t seem to work, you can try to install IPython from the conda-forge channel or directly with pip, or as a work-around, add ‘IPython.sphinxext.ipython_console_highlighting’ to extensions in your conf.py.

For details, see Anaconda issue \#1430\textsuperscript{17} and nbsphinx issue \#24\textsuperscript{18}.

\textsuperscript{17} https://github.com/ContinuumIO/anaconda-issues/issues/1430
\textsuperscript{18} https://github.com/spatialaudio/nbsphinx/issues/24
1.2.6 Jupyter Kernel

If you want to execute your notebooks during the Sphinx build process (see Controlling Notebook Execution (page 38)), you need an appropriate Jupyter kernel\ref{notebookkernels} installed.

For example, if you use Python, you should install the ipykernel package, e.g. with

```
conda install -c conda-forge ipykernel
```

or

```
python3 -m pip install ipykernel --user
```

If you created your notebooks yourself with Jupyter, it’s very likely that you have the right kernel installed already.

\ref{installation} ends here.

The following section was generated from doc/usage.ipynb

\section{ Usage }

\subsection{ Sphinx Setup }

In the directory with your notebook files, run this command (assuming you have Sphinx\ref{sphinx} installed already):

```
python3 -m sphinx.cmd.quickstart
```

Answer the questions that appear on the screen. In case of doubt, just press the \texttt{<Return>} key repeatedly to take the default values.

After that, there will be a few brand-new files in the current directory. You’ll have to make a few changes to the file named conf.py. You should at least check if those two variables contain the right things:

```
extensions = ['nbsphinx', 'sphinx.ext.mathjax', ]
exclude_patterns = ['_build', '**.ipynb_checkpoints']
```

For an example, see this project’s conf.py file.

Once your conf.py is in place, edit the file named index.rst and add the file names of your notebooks (without the .ipynb extension) to the toctree\ref{toctree} directive. For an example, see this project’s doc/index.rst file.

\begin{footnotes}
\end{footnotes}
2.1.1 Sphinx Configuration Values

All configuration values are described in the Sphinx documentation[^1], here we mention only the ones which may be relevant in combination with nbsphinx.

2.1.1.1 exclude_patterns

Sphinx builds all potential source files (reST files, Jupyter notebooks, ...) that are in the source directory, whether they are linked to or not. If you want certain files not to be built, specify them in `exclude_patterns`[^2]. For example, you might want to ignore files in your build directory and temporary Jupyter files:

```python
exclude_patterns = ['_build', '**.ipynb_checkpoints']
```

2.1.1.2 extensions

This is the only required value. You have to add 'nbsphinx' to the list of `extensions`[^3], otherwise it won't work.

Other interesting extensions are:

- 'sphinx.ext.mathjax' for math formulas (page 19)
- 'sphinxcontrib.bibtex' for bibliographic references (page 50)
- 'sphinxcontrib.rsvgconverter' for SVG->PDF conversion in LaTeX output (page 22)
- 'sphinx_copybutton' for adding “copy to clipboard” buttons[^4] to all text/code boxes

2.1.1.3 highlight_language

Default language for syntax highlighting in reST and Markdown cells, when no language is specified explicitly.

By default, this is 'python3', while Jupyter doesn't have a default language. Set `highlight_language`[^5] to 'none' to get the same behavior as in Jupyter:

```python
highlight_language = 'none'
```

See also `nbsphinx_codecell_lexer` (page 10).

2.1.1.4 html_scaled_image_link

As a work-around – until https://github.com/sphinx-doc/sphinx/issues/4229 is solved – you should set `html_scaled_image_link`[^6] to False:

```python
html_scaled_image_link = False
```

[^4]: https://sphinx-copybutton.readthedocs.io/
2.1.1.5 html_sourcelink_suffix

By default, a .txt suffix is added to source files. This is only relevant if the chosen HTML theme supports source links and if html_show_sourcelink\(^{28}\) is True.

Jupyter notebooks with the suffix .ipynb.txt are normally not very useful, so if you want to avoid the additional suffix, set html_sourcelink_suffix\(^{29}\) to the empty string:

\[
\text{html_sourcelink_suffix = ''}
\]

2.1.1.6 latex_additional_files

latex_additional_files\(^{30}\) can be useful if you are using BibTeX files, see References (page 50).

2.1.1.7 mathjax_config

The configuration value mathjax_config\(^{31}\) can be useful to enable Automatic Equation Numbering (page 19).

2.1.2 nbsphinx Configuration Values

2.1.2.1 nbsphinx_allow_errors

If True, the build process is continued even if an exception occurs.

See Ignoring Errors (page 40).

2.1.2.2 nbsphinx_codecell_lexer

Default Pygments lexer for syntax highlighting in code cells. If available, this information is taken from the notebook metadata instead.

Please note that this is not the same as highlight_language (page 9), which is used for formatting code in Markdown cells!

2.1.2.3 nbsphinx_custom_formats

See Custom Notebook Formats (page 45).

\(^{28}\) http://www.sphinx-doc.org/en/master/usage/configuration.html#confval-html_show_sourcelink
\(^{29}\) http://www.sphinx-doc.org/en/master/usage/configuration.html#confval-html_sourcelink_suffix
\(^{30}\) http://www.sphinx-doc.org/en/master/usage/configuration.html#confval-latex_additional_files
2.1.2.4 nbsphinx_epilog

See Prolog and Epilog (page 43).

2.1.2.5 nbsphinx_execute

Whether to execute notebooks before conversion or not. Possible values: 'always', 'never', 'auto' (default).
See Explicitly Dis-/Enabling Notebook Execution (page 39).

2.1.2.6 nbsphinx_execute_arguments

Kernel arguments used when executing notebooks.
If you use Matplotlib for plots (page 29), this setting is recommended:

```python
nbsphinx_execute_arguments = [
    "--InlineBackend.figure_formats={"svg", "pdf"},
    "--InlineBackend.rc={"figure.dpi": 96},",
]
```

If you don't use LaTeX/PDF output, you can drop the 'pdf' figure format.
See Configuring the Kernels (page 42).

2.1.2.7 nbsphinx_input_prompt

Input prompt for code cells. '%s' is replaced by the execution count.
To get a prompt similar to the Classic Notebook, use

```python
nbsphinx_input_prompt = 'In [%s]:'
```

2.1.2.8 nbsphinx_kernel_name

Use a different kernel than stored in the notebook metadata, e.g.:

```python
nbsphinx_kernel_name = 'python3'
```
See Configuring the Kernels (page 41).

2.1.2.9 nbsphinx_output_prompt

Output prompt for code cells. '%s' is replaced by the execution count.
To get a prompt similar to the Classic Notebook, use

```python
nbsphinx_output_prompt = 'Out[%s]:'
```
2.1.2.10 nbsphinx_prolog

See Prolog and Epilog (page 43).

2.1.2.11 nbsphinx_prompt_width

Width of input/output prompts (HTML only).
Any CSS length can be specified.

2.1.2.12 nbsphinx_requirejs_options

Options for loading RequireJS. See nbsphinx_requirejs_path (page 12).

2.1.2.13 nbsphinx_requirejs_path

URL or local path to override the default URL for RequireJS\(^{32}\).
If you use a local file, it should be located in a directory listed in html_static_path\(^{33}\).
Set to empty string to disable loading RequireJS.

2.1.2.14 nbsphinx_responsive_width

If the browser window is narrower than this, input/output prompts are on separate lines (HTML only).
Any CSS length can be specified.

2.1.2.15 nbsphinx_timeout

Controls when a cell will time out. Defaults to 30; use -1 for no timeout.
See Cell Execution Timeout (page 43).

2.1.2.16 nbsphinx_widgets_options

Options for loading Jupyter widgets resources. See nbsphinx_widgets_path (page 12).

2.1.2.17 nbsphinx_widgets_path

URL or local path to override the default URL for Jupyter widgets resources. See Interactive Widgets (HTML only) (page 33).
If you use a local file, it should be located in a directory listed in html_static_path\(^{34}\).
For loading the widgets resources, RequireJS is needed, see nbsphinx_requirejs_path (page 12).
If nbsphinx_widgets_path is not specified, widgets resources are only loaded if at least one notebook actually uses widgets. If you are loading the relevant JavaScript code by some other means already, you can set this option to the empty string to avoid loading it a second time.

\(^{32}\) https://requirejs.org/

\(^{33}\) http://www.sphinx-doc.org/en/master/usage/configuration.html#confval-html_static_path

\(^{34}\) http://www.sphinx-doc.org/en/master/usage/configuration.html#confval-html_static_path
2.2 Running Sphinx

To create the HTML pages, use this command:

```
python3 -m sphinx <source-dir> <build-dir>
```

If you have many notebooks, you can do a parallel build by using the `-j` option:

```
python3 -m sphinx <source-dir> <build-dir> -j<number-of-processes>
```

For example, if your source files are in the current directory and you have 4 CPU cores, you can run this:

```
python3 -m sphinx . _build -j4
```

Afterwards, you can find the main HTML file in `_build/index.html`.

Subsequent builds will be faster, because only those source files which have changed will be re-built. To force re-building all source files, use the `-E` option.

Note:

By default, notebooks will be executed during the Sphinx build process only if they do not have any output cells stored. See Controlling Notebook Execution (page 38).

To create LaTeX output, use:

```
python3 -m sphinx <source-dir> <build-dir> -b latex
```

If you don't know how to create a PDF file from the LaTeX output, you should have a look at Latexmk

(see also this tutorial).

Sphinx can automatically check if the links you are using are still valid. Just invoke it like this:

```
python3 -m sphinx <source-dir> <build-dir> -b linkcheck
```

2.3 Watching for Changes with sphinx-autobuild

If you think it’s tedious to run the Sphinx build command again and again while you make changes to your notebooks, you’ll be happy to hear that there is a way to avoid that: sphinx-autobuild!

It can be installed with

```
python3 -m pip install sphinx-autobuild --user
```

You can start auto-building your files with

```
python3 -m sphinx-autobuild <source-dir> <build-dir>
```

This will start a local webserver which will serve the generated HTML pages at http://localhost:8000/.

Whenever you save changes in one of your notebooks, the appropriate HTML page(s) will be re-built and when finished, your browser view will be refreshed automagically. Neat!

You can also abuse this to auto-build the LaTeX output:

35 http://personal.psu.edu/jcc/software/latexmk-jcc/
36 https://mg.readthedocs.io/latexmk.html
37 https://pypi.org/project/sphinx-autobuild
python3 -m sphinx_autobuild <source-dir> <build-dir> -b latex

However, to auto-build the final PDF file as well, you’ll need an additional tool. Again, you can use latexmk for this (see above (page 13)). Change to the build directory and run

latexmk -pdf -pvc

If your PDF viewer isn’t opened because of LaTeX build errors, you can use the command line flag \texttt{-f} to force creating a PDF file.

\section*{2.4 Automatic Creation of HTML and PDF output on readthedocs.org}

There are two different methods, both of which are described below.

In both cases, you’ll first have to create an account on \url{https://readthedocs.org/} and connect your GitLab/Github/Bitbucket/… account. Instead of connecting, you can also manually add any publicly available Git/Subversion/Mercurial/Bazaar/… repository.

After doing the steps described below, you only have to “push” to your repository, and the HTML pages and the PDF file of your stuff are automagically created on readthedocs.org. Awesome!

You can even have different versions of your stuff, just use Git tags and branches and select in the \url{readthedocs.org} settings\footnote{https://readthedocs.org/dashboard/} which of those should be created.

\textbf{Note:}

If you want to execute notebooks (see \textit{Controlling Notebook Execution} (page 38)), you’ll need to install the appropriate Jupyter kernel. In the examples below, the IPython kernel is installed from the packet \texttt{ipykernel}.

\subsection*{2.4.1 Using requirements.txt}

1. Create a file named \texttt{.readthedocs.yml} in the main directory of your repository with the following contents:

\begin{verbatim}
yaml version: 2 formats: all python: version: 3 install: - requirements: doc/ requirements.txt system_packages: true
\end{verbatim}

For further options see \url{https://docs.readthedocs.io/en/latest/config-file/}.

1. Create a file named \texttt{doc/requirements.txt} (or whatever you chose in the previous step) containing the required \texttt{pip} packages:

\begin{verbatim}
ipykernel nbsphinx
\end{verbatim}

You can also install directly from Github et al., using a specific branch/tag/commit, e.g.

\begin{verbatim}
git+https://github.com/spatialaudio/nbsphinx.git@master
\end{verbatim}
2.4.2 Using conda

1. Create a file named `.readthedocs.yml` in the main directory of your repository with the following contents:

```yaml
yaml version: 2
formats: all
conda: file: doc/environment.yml
```

For further options see https://docs.readthedocs.io/en/latest/config-file/.

1. Create a file named `doc/environment.yml` (or whatever you chose in the previous step) describing a conda environment39 like this:

```yaml
channels: - conda-forge
dependencies: - python>=3
       - pandoc
       - ipykernel
       - pip
       - nbsphinx
```

It is up to you if you want to install nbsphinx with conda or with pip (but note that the conda package might be outdated). And you can of course add further conda and pip packages. You can also install packages directly from Github et al., using a specific branch/tag/commit, e.g.

```yaml
pip: - git+https://github.com/spatialaudio/nbsphinx.git@master
```

Note: The specification of the conda-forge channel is recommended because it tends to have more recent package versions than the default channel.

2.5 HTML Themes

The nbsphinx extension does not provide its own theme, you can use any of the available themes or create a custom one40, if you feel like it.

The following (incomplete) list of themes contains up to three links for each theme:

1. The documentation (or the official sample page) of this theme (if available; see also the documentation of the built-in Sphinx themes41)

2. How the nbsphinx documentation looks when using this theme

3. How to enable this theme using either `requirements.txt` or `readthedocs.yml` and theme-specific settings (in some cases)

2.5.1 Sphinx's Built-In Themes

- agogo: example42, usage43
- alabaster44: example45, usage46
- bizstyle: example47, usage48
- classic: example49, usage50

2.6 Using Notebooks with Git

Git is extremely useful for managing source code and it can and should also be used for managing Jupyter notebooks. There is one caveat, however: Notebooks can contain output cells with rich media like images, plots, sounds, HTML, JavaScript and many other types of bulky machine-created content. This can make it hard to work with Git efficiently, because changes in those bulky contents can completely obscure the more interesting human-made changes in text and source code. Working with multiple collaborators on a notebook can become very tedious because of this.

It is therefore highly recommended that you remove all outputs from your notebooks before committing changes to a Git repository (except for the reasons mentioned in Pre-Executing Notebooks (page 38)).

If there are no output cells in a notebook, nbsphinx will by default execute the notebook, and the pages generated by Sphinx will therefore contain all the output cells. See Controlling Notebook Execution (page 38) for how this behavior can be customized.

In the Jupyter Notebook application, you can manually clear all outputs by selecting “Cell” → “All Output” → “Clear” from the menu. In JupyterLab, the menu items are “Edit” → “Clear All Outputs”.

There are several tools available to remove outputs from multiple files at once without having to open them separately. You can even include such a tool as “clean/smudge filters” into your Git workflow, which will strip the output cells automatically whenever a Git command is executed. For details, have a look at those links:

- [https://github.com/kynan/nbstripout](https://github.com/kynan/nbstripout)
- [https://github.com/toobaz/ipynb_output_filter](https://github.com/toobaz/ipynb_output_filter)
- [https://pascalbugnion.net/blog/ipython-notebooks-and-git.html](https://pascalbugnion.net/blog/ipython-notebooks-and-git.html)
- [https://github.com/choldgraf/nbclean](https://github.com/choldgraf/nbclean)
- [https://jamesfolberth.org/articles/2017/08/07/git-commit-hook-for-jupyter-notebooks/](https://jamesfolberth.org/articles/2017/08/07/git-commit-hook-for-jupyter-notebooks/)

The following section was generated from doc/markdown-cells.ipynb

3 Markdown Cells

We can use *emphasis*, **boldface**, preformatted text.

It looks like strike-out text is not supported: [STRIKEOUT: strikethrough].

- Red
- Green
- Blue

1. One
2. Two
3. Three

Arbitrary Unicode characters should be supported, e.g. łß ¯o. Note, however, that this only works if your HTML browser and your LaTeX processor provide the appropriate fonts.

---

124 [https://git-scm.com/](https://git-scm.com/)
3.1 Equations

Inline equations like $e^{i\pi} = -1$ can be created by putting a LaTeX expression between two dollar signs, like this: $\text{e}^{i\pi} = -1$.

**Note:**

Avoid leading and trailing spaces around math expressions, otherwise errors like the following will occur when Sphinx is running:

```
ERROR: Unknown interpreted text role "raw-latex".
```

See also the pandoc docs:\(^{125}\):

Anything between two $ characters will be treated as TeX math. The opening $ must have a non-space character immediately to its right, while the closing $ must have a non-space character immediately to its left, and must not be followed immediately by a digit.

Equations can also be displayed on their own line like this:

\[
\int_{-\infty}^{\infty} f(x) \delta(x - x_0) dx = f(x_0).
\]

This can be done by simply using one of the LaTeX math environments, like so:

```
\begin{equation}
\int_{-\infty}^{\infty} f(x) \delta(x - x_0) dx = f(x_0).
\end{equation}
```

**Note:**

For equations to be shown in HTML output, you have to specify a math extension\(^{126}\) in your extensions (page 9) setting, e.g.:

```
extensions = [
    'nbsphinx',
    'sphinx.ext.mathjax',
    # ... other useful extensions ...
]
```

3.1.1 Automatic Equation Numbering

This is not automatically enabled in Jupyter notebooks, but you can install a notebook extension in order to enable equation numbering: https://jupyter-contrib-nbextensions.readthedocs.io/en/latest/nbextensions/equation-numbering/readme.html.

Automatic Equation Numbering is enabled on https://nbviewer.jupyter.org/, see e.g. the latest version of this very notebook at the link https://nbviewer.jupyter.org/github/spatialaudio/nbsphinx/blob/master/doc/markdown-cells.ipynb#Automatic-Equation-Numbering.

When using nbsphinx, you can use the following mathjax_config setting in your conf.py file to enable automatic equation numbering in HTML output. In LaTeX output, the equations are numbered by default.

---

\(^{125}\) https://pandoc.org/MANUAL.html#math

You can use `\label{...}` to give a unique label to an equation:

$$\phi = \frac{1 + \sqrt{5}}{2}$$  \hfill (2)

If automatic equation numbering is enabled, you can later reference that equation using its label. You can use `\eqref{golden-mean}` for a reference with parentheses: \textsuperscript{(2)}, or `\ref{golden-mean}` for a reference without them: 2.

In HTML output, these equation references only work for equations within a single HTML page. In LaTeX output, equations from other notebooks can be referenced, e.g. \textsuperscript{(08.15)}.

3.1.2 Manual Equation Numbering

If you prefer to assign equation numbers (or some kind of names) manually, you can do so with `\tag{...}`:

$$a^2 + b^2 = c^2 \quad \tag{99.4}$$

The above equation has the number 99.4.

3.2 Citations

Example: [KRKP+16].

\begin{verbatim}
<cite data-cite="kluyver2016jupyter">Kluyver et al. (2016)</cite>
\end{verbatim}

You don’t actually have to use `\cite`, any inline HTML tag can be used, e.g. `\strong`: [PGH11].

\begin{verbatim}
<strong data-cite="perez2011python">Python: An Ecosystem for Scientific Computing</strong>
\end{verbatim}

You’ll also have to define a list of references, see the section about references (page 50).

There is also a Notebook extension which may or may not be useful: https://github.com/takluyver/cite2c.
3.3 Code

We can also write code with nice syntax highlighting:

```python
print("Hello, world!")
```

3.4 Tables

<table>
<thead>
<tr>
<th>A</th>
<th>B</th>
<th>A and B</th>
</tr>
</thead>
<tbody>
<tr>
<td>False</td>
<td>False</td>
<td>False</td>
</tr>
<tr>
<td>True</td>
<td>False</td>
<td>False</td>
</tr>
<tr>
<td>False</td>
<td>True</td>
<td>False</td>
</tr>
<tr>
<td>True</td>
<td>True</td>
<td>True</td>
</tr>
</tbody>
</table>

3.5 Images

Local image:

![Jupyter notebook icon](images/notebook_icon.png)

Remote image:

![Python logo (remote)](https://www.python.org/static/img/python-logo-large.png)
3.5.1 SVG support for LaTeX

LaTeX doesn’t support SVG images, but there are Sphinx extensions that can be used for automatically converting SVG images for inclusion in LaTeX output.

Just include one of the following options in the list of `extensions` (page 9) in your `conf.py` file.

- `'sphinxcontrib.inkscapeconverter'` or `'sphinxcontrib.rsvgconverter'`: See [https://github.com/missinglinkelectronics/sphinxcontrib-svg2pdfconverter](https://github.com/missinglinkelectronics/sphinxcontrib-svg2pdfconverter) for installation instructions.

The external programs `inkscape` or `rsvg-convert` (Debian/Ubuntu package `librsvg2-bin`) are needed, respectively.

This needs the external program `convert` from `ImageMagick`.

The disadvantage of this extension is that SVGs are converted to bitmap images.

If one of those extensions is installed, SVG images can be used even for LaTeX output:

![Python logo](images/python_logo.svg)

Remote SVG images can also be used (and will be shown in the LaTeX output):

![Jupyter logo](https://jupyter.org/assets/main-logo.svg)

3.6 Cell Attachments

Images can also be embedded in the notebook itself. Just drag an image file into the Markdown cell you are just editing or copy and paste some image data from an image editor/viewer.

The generated Markdown code will look just like a “normal” image link, except that it will have an `attachment:` prefix:

![a stick figure](attachment:stickfigure.png)

This is a cell attachment: 🧠
In the Jupyter Notebook, there is a special "Attachments" cell toolbar which you can use to see all attachments of a cell and delete them, if needed.

### 3.7 HTML Elements (HTML only)

It is allowed to use plain HTML elements within Markdown cells. Those elements are passed through to the HTML output and are ignored for the LaTeX output. Below are a few examples.

**HTML5 audio** elements can be created like this:

```html
<audio src="https://example.org/audio.ogg" controls>alternative text</audio>
```

Example:
The HTML audio element is not supported!

**HTML5 video** elements can be created like this:

```html
<video src="https://example.org/video.ogv" controls>alternative text</video>
```

Example:
The HTML video element is not supported!

The alternative text is shown in browsers that don’t support those elements. The same text is also shown in Sphinx’s LaTeX output.

**Note:** You can also use local files for the `<audio>` and `<video>` elements, but you have to create a link to the source file somewhere, because only then are the local files copied to the HTML output directory! You should do that anyway to make the audio/video file accessible to browsers that don’t support the `<audio>` and `<video>` elements.

### 3.8 Info/Warning Boxes

**Warning:**

This is an experimental feature! Its usage will probably change in the future or it might be removed completely!

Until there is an info/warning extension for Markdown/CommonMark (see this issue[^129]), such boxes can be created by using HTML `<div>` elements like this:

```html
<div class="alert alert-info">
**Note:** This is a note!
</div>
```

For this to work reliably, you should obey the following guidelines:

- The class attribute has to be either "alert alert-info" or "alert alert-warning", other values will not be converted correctly.

[^129]: https://github.com/jupyter/notebook/issues/1292
• No further attributes are allowed.
• For compatibility with CommonMark, you should add an empty line between the `<div>` start tag and the beginning of the content.

**Note:**
The text can contain further Markdown formatting. It is even possible to have nested boxes:

... but please don’t *overuse* this!

### 3.9 Links to Other Notebooks

Relative links to local notebooks can be used: *a link to a notebook in a subdirectory* (page 46), a link to an orphan notebook (latter won’t work in LaTeX output, because orphan pages are not included there).

This is how a link is created in Markdown:

```
[a link to a notebook in a subdirectory](subdir/a-notebook-in-a-subdir.ipynb)
```

Markdown also supports *reference-style links*: *a reference-style link* (page 46), *another version of the same link* (page 46).

These can be created with this syntax:

```
[a reference-style link][mylink]
```

```
[mylink]: subdir/a-notebook-in-a-subdir.ipynb
```

Links to sub-sections are also possible, e.g. *this subsection* (page 46).

This link was created with:

```
[this subsection](subdir/a-notebook-in-a-subdir.ipynb#A-Sub-Section)
```

You just have to remember to replace spaces with hyphens!

BTW, links to sections of the current notebook work, too, e.g. *beginning of this section* (page 24).

This can be done, as expected, like this:

```
[beginning of this section](#Links-to-Other-Notebooks)
```

### 3.10 Links to *.rst* Files (and Other Sphinx Source Files)

Links to files whose extension is in the configuration value `source_suffix`\(^\text{139}\), will be converted to links to the generated HTML/LaTeX pages. Example: *A reStructuredText file* (page 48).

This was created with:

```
[A reStructuredText file](a-normal-rst-file.rst)
```

Links to sub-sections are also possible. Example: *Sphinx Directives* (page 49).

This was created with:

\(^\text{139}\) https://www.sphinx-doc.org/en/master/config.html#confval-source_suffix
Note:

Sphinx section anchors are different from Jupyter section anchors! To create a link to a subsection in an .rst file (or another non-notebook source file), you not only have to replace spaces with hyphens, but also slashes and some other characters. In case of doubt, just check the target HTML page generated by Sphinx.

3.11 Links to Local Files

Links to local files (other than Jupyter notebooks and other Sphinx source files) are also possible, e.g. requirements.txt.

This was simply created with:

[requirements.txt](requirements.txt)

The linked files are automatically copied to the HTML output directory. For LaTeX output, links are created, but the files are not copied to the target directory.

3.12 Links to Domain Objects

Links to Sphinx domain objects\(^{131}\) (such as a Python class or JavaScript function) are also possible. For example: `example_python_function()` (page 50).

This was created with:

`example_python_function()`(a-normal-rst-file.rst#example_python_function)

This is especially useful for use with the Sphinx autodoc\(^{132}\) extension!

The following section was generated from `doc/code-cells.ipynb` ...

4 Code Cells

4.1 Code, Output, Streams

An empty code cell:

```
[
]
```

Two empty lines:

```
[
]
```

Leading/trailing empty lines:

A simple output:

\[ 6 \times 7 \]

\[ 42 \]

The standard output stream:

```
print('Hello, world!')
```

Hello, world!

Normal output + standard output

```
print('Hello, world!')
6 * 7
Hello, world!
```

\[ 42 \]

The standard error stream is highlighted and displayed just below the code cell. The standard output stream comes afterwards (with no special highlighting). Finally, the “normal” output is displayed.

```
import sys
print("I'll appear on the standard error stream", file=sys.stderr)
print("I'll appear on the standard output stream")
"I'm the 'normal' output"
```

I'll appear on the standard output stream
I'll appear on the standard error stream
"I'm the 'normal' output"

**Note:**

Using the IPython kernel, the order is actually mixed up, see [https://github.com/ipython/ipykernel/issues/280](https://github.com/ipython/ipykernel/issues/280).

### 4.2 Cell Magics

IPython can handle code in other languages by means of cell magics\(^{133}\):

```
%%bash
for i in 1 2 3
do
  echo $i
done
```

1
2
3

4.3 Special Display Formats

See IPython example notebook\textsuperscript{134}.

4.3.1 Local Image Files

\begin{Verbatim}
[7]: from IPython.display import Image
    i = Image(filename='images/notebook_icon.png')
    i
\end{Verbatim}

\begin{Verbatim}
[8]: display(i)
\end{Verbatim}

See also SVG support for \textit{LaTeX} (page 22).

\begin{Verbatim}
[9]: from IPython.display import SVG
    SVG(filename='images/python_logo.svg')
\end{Verbatim}

\textsuperscript{134} https://nbviewer.jupyter.org/github/ipython/ipython/blob/master/examples/IPython%20Kernel/Rich%20output.ipynb
4.3.2 Image URLs

[10]: Image(url='https://www.python.org/static/img/python-logo-large.png')
[10]: <IPython.core.display.Image object>

4.3.3 Math

[13]: from IPython.display import Math
    eq = Math(r'\int_{-\infty}^{\infty} f(x) \delta(x - x_0) dx = f(x_0)')
    eq
[13]: \int_{-\infty}^{\infty} f(x)\delta(x - x_0)dx = f(x_0)

[14]: display(eq)
[14]: \int_{-\infty}^{\infty} f(x)\delta(x - x_0)dx = f(x_0)

[15]: from IPython.display import Latex
    Latex(r'This is a \LaTeX{} equation: $a^2 + b^2 = c^2$')
[15]: This is a \LaTeX{} equation: $a^2 + b^2 = c^2$

[16]: \begin{equation}
    \int_{-\infty}^{\infty} f(x) \delta(x - x_0) dx = f(x_0)
\end{equation}

\[ \int_{-\infty}^{\infty} f(x)\delta(x - x_0)dx = f(x_0) \] (3)
### 4.3.4 Plots

The output formats for Matplotlib plots can be customized. You’ll need separate settings for the Jupyter Notebook application and for *nbsphinx*.

If you want to use SVG images for Matplotlib plots, add this line to your IPython configuration file:

```python
c.InlineBackend.figure_formats = {'svg'}
```

If you want SVG images, but also want nice plots when exporting to LaTeX/PDF, you can select:

```python
c.InlineBackend.figure_formats = {'svg', 'pdf'}
```

If you want to use the default PNG plots or HiDPI plots using 'png2x' (a.k.a. 'retina'), make sure to set this:

```python
c.InlineBackend.rc = {'figure.dpi': 96}
```

This is needed because the default 'figure.dpi' value of 72 is only valid for the Qt Console\(^{135}\).

If you are planning to store your SVG plots as part of your notebooks, you should also have a look at the `svg.hashsalt` setting.

For more details on these and other settings, have a look at Default Values for Matplotlib’s “inline” Backend\(^{136}\).

The configuration file `ipython_kernel_config.py` can be either in the directory where your notebook is located (see the `ipython_kernel_config.py` in this directory), or in your profile directory (typically ~/.ipython/profile_default/ipython_kernel_config.py). To find out your IPython profile directory, use this command:

```
python3 -m IPython profile locate
```

A local `ipython_kernel_config.py` in the notebook directory also works on https://mybinder.org/. Alternatively, you can create a file with those settings in a file named .ipython/profile_default/ipython_kernel_config.py in your repository.

To get SVG and PDF plots for *nbsphinx*, use something like this in your `conf.py` file:

```python
nbsphinx_execute_arguments = [
    "--InlineBackend.figure_formats={'svg', 'pdf'},",
    "--InlineBackend.rc={'figure.dpi': 96},",
]
```

In the following example, *nbsphinx* should use an SVG image in the HTML output and a PDF image for LaTeX/PDF output.

```python
[17]: import matplotlib.pyplot as plt
[18]: fig, ax = plt.subplots(figsize=[6, 3])
ax.plot([4, 9, 7, 20, 6, 33, 13, 23, 16, 62, 8]);
```

\(^{135}\) [https://qtconsole.readthedocs.io/](https://qtconsole.readthedocs.io/)

Alternatively, the figure format(s) can also be chosen directly in the notebook (which overrides the setting in `nbsphinx_execute_arguments` and in the IPython configuration):

[19]: `%config InlineBackend.figure_formats = ['png']`

[20]: `fig`

If you want to use PNG images, but with HiDPI resolution, use the special `png2x` (a.k.a. 'retina') format (which also looks nice in the LaTeX output):

[21]: `%config InlineBackend.figure_formats = ['png2x']`

[22]: `fig`
4.3.5 Pandas Dataframes

Pandas dataframes\(^\text{137}\) should be displayed as nicely formatted HTML tables (if you are using HTML output).

```python
import numpy as np
import pandas as pd
```

```python
df = pd.DataFrame(np.random.randint(0, 100, size=[5, 4]),
                 columns=['a', 'b', 'c', 'd'])
df
```

<table>
<thead>
<tr>
<th></th>
<th>a</th>
<th>b</th>
<th>c</th>
<th>d</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>71</td>
<td>28</td>
<td>27</td>
<td>82</td>
</tr>
<tr>
<td>1</td>
<td>38</td>
<td>21</td>
<td>93</td>
<td>12</td>
</tr>
<tr>
<td>2</td>
<td>27</td>
<td>43</td>
<td>68</td>
<td>34</td>
</tr>
<tr>
<td>3</td>
<td>33</td>
<td>62</td>
<td>3</td>
<td>46</td>
</tr>
<tr>
<td>4</td>
<td>41</td>
<td>44</td>
<td>23</td>
<td>67</td>
</tr>
</tbody>
</table>

For LaTeX output, however, the plain text output is used by default. To get nice LaTeX tables, a few settings have to be changed:

```python
pd.set_option('display.latex.repr', True)
```

This is not enabled by default because of Pandas issue #12182\(^\text{138}\).

The generated LaTeX tables utilize the booktabs package, so you have to make sure that package is loaded in the preamble\(^\text{139}\) with:

\usepackage{booktabs}

In order to allow page breaks within tables, you should use:

```python
pd.set_option('display.latex.longtable', True)
```

The longtable package is already used by Sphinx, so you don’t have to manually load it in the preamble.

\(^\text{137}\) https://pandas.pydata.org/pandas-docs/stable/getting_started/dsintro.html#dataframe
\(^\text{138}\) https://github.com/pandas-dev/pandas/issues/12182
\(^\text{139}\) https://www.sphinx-doc.org/en/master/latex.html
Finally, if you want to use LaTeX math expressions in your dataframe, you’ll have to disable escaping:

```
[27]: pd.set_option('display.latex.escape', False)
```

The above settings should have no influence on the HTML output, but the LaTeX output should now look nicer:

```
[28]: df = pd.DataFrame(np.random.randint(0, 100, size=[10, 4]),
                     columns=[r'$\alpha$', r'$\beta$', r'$\gamma$', r'$\delta$'])
```

```
<table>
<thead>
<tr>
<th></th>
<th>α</th>
<th>β</th>
<th>γ</th>
<th>δ</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>71</td>
<td>7</td>
<td>22</td>
<td>21</td>
</tr>
<tr>
<td>1</td>
<td>19</td>
<td>31</td>
<td>96</td>
<td>67</td>
</tr>
<tr>
<td>2</td>
<td>64</td>
<td>5</td>
<td>2</td>
<td>66</td>
</tr>
<tr>
<td>3</td>
<td>66</td>
<td>81</td>
<td>57</td>
<td>62</td>
</tr>
<tr>
<td>4</td>
<td>28</td>
<td>25</td>
<td>6</td>
<td>22</td>
</tr>
<tr>
<td>5</td>
<td>2</td>
<td>13</td>
<td>10</td>
<td>16</td>
</tr>
<tr>
<td>6</td>
<td>65</td>
<td>47</td>
<td>37</td>
<td>85</td>
</tr>
<tr>
<td>7</td>
<td>84</td>
<td>12</td>
<td>76</td>
<td>2</td>
</tr>
<tr>
<td>8</td>
<td>83</td>
<td>72</td>
<td>78</td>
<td>64</td>
</tr>
<tr>
<td>9</td>
<td>19</td>
<td>7</td>
<td>58</td>
<td>1</td>
</tr>
</tbody>
</table>
```

4.3.6 YouTube Videos

```
[29]: from IPython.display import YouTubeVideo
   YouTubeVideo('WAikxUGbomY')
```

![YouTube Video](WAikxUGbomY)
4.3.7 Interactive Widgets (HTML only)

The basic widget infrastructure is provided by the `ipywidgets`\(^{140}\) module. More advanced widgets are available in separate packages, see for example [https://jupyter.org/widgets](https://jupyter.org/widgets).

The JavaScript code which is needed to display Jupyter widgets is loaded automatically (using RequireJS). If you want to use non-default URLs or local files, you can use the `nbsphinx_widgets_path` (page 12) and `nbsphinx_requirejs_path` (page 12) settings.

```python
[30]: import ipywidgets as w

[31]: slider = w.IntSlider()
slider.value = 42
slider
IntSlider(value=42)
```

A widget typically consists of a so-called “model” and a “view” into that model. If you display a widget multiple times, all instances act as a “view” into the same “model”. That means that their state is synchronized. You can move either one of these sliders to try this out:

```python
[32]: slider
IntSlider(value=42)
```

You can also link different widgets.

Widgets can be linked via the kernel (which of course only works while a kernel is running) or directly in the client (which even works in the rendered HTML pages).

Widgets can be linked uni- or bi-directionally.

Examples for all 4 combinations are shown here:

```python
[33]: link = w.IntSlider(description='link')
    w.link(((slider, 'value'), (link, 'value')))
jslink = w.IntSlider(description='jslink')
    w.jslink(((slider, 'value'), (jslink, 'value'))) 
dlink = w.IntSlider(description='dlink')
    w.dlink(((slider, 'value'), (dlink, 'value'))) 
jsdlink = w.IntSlider(description='jsdlink')
    w.jsdlink(((slider, 'value'), (jsdlink, 'value'))) 
w.VBox([link, jslink, dlink, jsdlink])
VBox(children=(IntSlider(value=42, description='link'), IntSlider(value=0, description='jslink'), IntSlider(value=0))
```

Other Languages:

The examples shown here are using Python, but the widget technology can also be used with different Jupyter kernels (i.e. with different programming languages).

\(^{140}\) [https://ipywidgets.readthedocs.io/](https://ipywidgets.readthedocs.io/)
4.3.8 Arbitrary JavaScript Output (HTML only)

4.3.9 Unsupported Output Types

If a code cell produces data with an unsupported MIME type, the Jupyter Notebook doesn’t generate any output. nbsphinx, however, shows a warning message.

4.4 ANSI Colors

The standard output and standard error streams may contain ANSI escape sequences to change the text and background colors.

The following code showing the 8 basic ANSI colors is based on http://tldp.org/HOWTO/Bash-Prompt-HOWTO/x329.html. Each of the 8 colors has an “intense” variation, which is used for bold text.
ANSI also supports a set of 256 indexed colors. The following code showing all of them is based on http://bitmote.com/index.php?post/2012/11/19/Using-ANSI-Color-Codes-to-Colorize-Your-Bash-Prompt-on-Linux[^1].

```python
[38]: formatstring = '{rgb[0]}{};3{rgb[1]}{};3{rgb[2]}m'

print('{:4}'.format(i) + ''.join(formatstring.format(i) for i in range(36)))
print('{:4}'.join(formatstring.format(i) for i in range(16)))
for i in range(7):
    i = i * 36 + 16
    print('{:3}'.format(i) + ''.join(formatstring.format(i + j)
                            for j in range(36) if i + j < 256))
```

You can even use 24-bit RGB colors:

```python
[39]: start = 255, 0, 0
end = 0, 0, 255
length = 79
out = []
for i in range(length):
    rgb = [start[c] + int((end[c] - start[c]) / length) for c in range(3)]
    out.append('{}[rgb]'.format(rgb=rgb))
print(''.join(out))
```

5 Raw Cells

The “Raw NBConvert” cell type can be used to render different code formats into HTML or LaTeX by Sphinx. This information is stored in the notebook metadata and converted appropriately.

5.1 Usage

To select a desired format from within Jupyter, select the cell containing your special code and choose options from the following dropdown menus:

1. Select “Raw NBConvert”
2. Switch the Cell Toolbar to “Raw Cell Format”
3. Chose the appropriate “Raw NBConvert Format” within the cell

5.2 Available Raw Cell Formats

The following examples show how different Jupyter cell formats are rendered by Sphinx.
5.2.1 None

By default (if no cell format is selected), the cell content is included (without any conversion) in both the HTML and LaTeX output. This is typically not useful at all.

"I'm a raw cell with no format."

5.2.2 reST

Raw cells in “reST” format are interpreted as reStructuredText and parsed by Sphinx. The result is visible in both HTML and LaTeX output.

"I'm a raw cell in reST\[143\] format."

5.2.3 Markdown

Raw cells in “Markdown” format are interpreted as Markdown, and the result is included in both HTML and LaTeX output. Since the Jupyter Notebook also supports normal Markdown cells, this might not be useful at all.

"I'm a raw cell in Markdown\[144\] format."

5.2.4 HTML

Raw cells in “HTML” format are only visible in HTML output. This option might not be very useful, since raw HTML code is also allowed within normal Markdown cells.

5.2.5 LaTeX

Raw cells in “LaTeX” format are only visible in LaTeX output.

I'm a raw cell in \LaTeX\[145\] format.

5.2.6 Python

Raw cells in “Python” format are not visible at all (nor executed in any way).

The following section was generated from doc/hidden-cells.ipynb

6 Hidden Cells

You can remove cells from the HTML/LaTeX output by adding this to the cell metadata:

"nbsphinx": "hidden"

Hidden cells are still executed but removed afterwards.

For example, the following hidden cell defines the variable answer.

This is the cell after the hidden cell. Although the previous cell is not visible, its result is still available:

\[2\]: answer

---

\[143\] https://www.sphinx-doc.org/rest.html
\[144\] https://daringfireball.net/projects/markdown/

37
Don’t overuse this, because it may make it harder to follow what’s going on in your notebook. Also Markdown cells can be hidden. The following cell is hidden.

This is the cell after the hidden cell.

7 Controlling Notebook Execution

Notebooks with no outputs are automatically executed during the Sphinx build process. If, however, there is at least one output cell present, the notebook is not evaluated and included as is.

The following notebooks show how this default behavior can be used and customized.

7.1 Pre-Executing Notebooks

Automatically executing notebooks during the Sphinx build process is an important feature of nbsphinx. However, there are a few use cases where pre-executing a notebook and storing the outputs might be preferable. Storing any output will, by default, stop nbsphinx from executing the notebook.

7.1.1 Long-Running Cells

If you are doing some very time-consuming computations, it might not be feasible to re-execute the notebook every time you build your Sphinx documentation.

So just do it once – when you happen to have the time – and then just keep the output.

If you do want to execute your notebooks, but some cells run for a long time, you can change the timeout, see Cell Execution Timeout (page 43).

7.1.2 Rare Libraries

You might have created results with a library that’s hard to install and therefore you have only managed to install it on one very old computer in the basement, so you probably cannot run this whenever you build your Sphinx docs.

If you do want to execute your notebooks, but some cells run for a long time, you can change the timeout, see Cell Execution Timeout (page 43).
### 7.1.3 Exceptions

If an exception is raised during the Sphinx build process, it is stopped (the build process, not the exception!). If you want to show to your audience how an exception looks like, you have two choices:

1. **Allow errors** – either generally or on a per-notebook or per-cell basis – see [Ignoring Errors](page 40) ([per cell](page 41)).
2. Execute the notebook beforehand and save the results, like it’s done in this example notebook:

```python
1 / 0
```

```
ZeroDivisionError Traceback (most recent call last)
<ipython-input-5-b710d87c980c> in <module>()
----> 1 1 / 0

ZeroDivisionError: division by zero
```

### 7.1.4 Client-specific Outputs

When `nbsphinx` executes notebooks, it uses the `nbconvert` module to do so. Certain Jupyter clients might produce output that differs from what `nbconvert` would produce. To preserve those original outputs, the notebook has to be executed and saved before running Sphinx.

For example, the JupyterLab help system shows the help text as cell outputs, while executing with `nbconvert` doesn’t produce any output.

### 7.2 Explicitly Dis-/Enabling Notebook Execution

If you want to include a notebook without outputs and yet don’t want `nbsphinx` to execute it for you, you can explicitly disable this feature.

You can do this globally by setting the following option in `conf.py`:

```
nbsphinx_execute = 'never'
```

Or on a per-notebook basis by adding this to the notebook’s JSON metadata:

```
"nbsphinx": {  
  "execute": "never"  
},
```
There are three possible settings, "always``, "auto`` and "never``. By default (= "auto``), notebooks with no outputs are executed and notebooks with at least one output are not. As always, per-notebook settings take precedence over the settings in conf.py.

This very notebook has its metadata set to "never``, therefore the following cell is not executed:

```
[ ]: 6 * 7
```

The following section was generated from doc/allow-errors.ipynb

### 7.3 Ignoring Errors

Normally, if an exception is raised while executing a notebook, the Sphinx build process is stopped immediately.

If a notebook contains errors on purpose (or if you are too lazy to fix them right now), you have four options:

1. Manually execute the notebook in question and save the results, see the pre-executed example notebook (page 38).
2. Allow errors in all notebooks by setting this option in conf.py: nbsphinx_allow_errors = True
3. Allow errors on a per-notebook basis by adding this to the notebook's JSON metadata: "nbsphinx": { "allow_errors": true },
4. Allow errors on a per-cell basis using the raises-exception tag, see Ignoring Errors on a Cell-by-Cell Basis (page 41).

This very notebook is an example for the third option. The results of the following code cells are not stored within the notebook, therefore it is executed during the Sphinx build process. Since the above-mentioned allow Errors flag is set in this notebook’s metadata, all cells are executed although most of them cause an exception.

```
[1]: nonsense
```

```
NameError Traceback (most recent call last)
<ipython-input-1-7dd4c0df649c> in <module>
----> 1 nonsense

NameError: name 'nonsense' is not defined
```

```
[2]: 42 / 0
```

```
ZeroDivisionError Traceback (most recent call last)
<ipython-input-2-52cebea8b64f> in <module>
----> 1 42 / 0

ZeroDivisionError: division by zero
```

```
[3]: print 'Hello, world!'
```

```
File "<ipython-input-3-653b30cd70a8>", line 1
  print 'Hello, world!'```

SyntaxError: Missing parentheses in call to 'print'. Did you mean print('Hello, world')?
7.4 Ignoring Errors on a Per-Cell Basis

Instead of ignoring errors for all notebooks or for some selected notebooks (see the previous notebook (page 40)), you can be more fine-grained and just allow errors on certain code cells by tagging them with the raises-exception tag.

The following code cell has the raises-exception tag.

```
problem

---------------------------------------------------------------------------
NameError       Traceback (most recent call last)
<ipython-input-2-526ab3a89ffc> in <module>
----> 1 problem

NameError: name 'problem' is not defined
```

The following code cell is executed even though the previous cell raised an exception.

```
'no problem'
'no problem'
```

Note:
The behavior of the raises-exception tag doesn’t match its name. While it does allow exceptions, it does not check if an exception is actually raised!

This will hopefully be fixed at some point, see https://github.com/jupyter/nbconvert/issues/730.

7.5 Configuring the Kernels

7.5.1 Kernel Name

If we have multiple kernels installed, we can choose to override the kernel saved in the notebook using nbsphinx_kernel_name (page 11):
nbsphinx_kernel_name = 'python-upstream-dev'

which uses the kernel named python-upstream-dev instead of the kernel name stored in the notebook.

7.5.2 Kernel Arguments

We can also pass options to the kernel by setting `nbsphinx_execute_arguments` (page 11) in `conf.py`. These work the same way as `ipython_kernel_config.py`. For example, using

```python
nbsphinx_execute_arguments = [
    "--InlineBackend.rc={'figure.dpi': 96},"
]
```

to set plot options (page 29) is the same as writing:

```python
c.InlineBackend.rc = {'figure.dpi': 96}
```

in `ipython_kernel_config.py` or using:

```python
%config InlineBackend.rc={'figure.dpi': 96}
```

at the top of a notebook:

[1]: get_ipython().config.InlineBackend.rc

[1]: {'figure.dpi': 96}

7.5.3 Environment Variables

The contents of `os.environ` after the execution of `conf.py` will be passed as environment variables to the kernel. As an example, `MY_DUMMY_VARIABLE` has been set in `conf.py` like this:

```python
import os
os.environ['MY_DUMMY_VARIABLE'] = 'Hello from conf.py!'
```

... and it can be checked in the notebook like this:

[2]: import os

[2]: os.environ['MY_DUMMY_VARIABLE']

[2]: 'Hello from conf.py!'

This is useful if we want to edit PYTHONPATH in order to compile the documentation without installing the project:

```python
import os
src = os.path.abspath(../src)
os.environ['PYTHONPATH'] = src
```

If you are using https://mybinder.org/ and you want to define environment variables, you should create a file `.binder/start` in your repository (see Binder docs:\footnote{https://mybinder.readthedocs.io/en/latest/config_files.html#start-run-code-before-the-user-sessions-starts}) containing definitions like this:
# Cell Execution Timeout

By default, nbconvert (which is used to execute the notebooks during the Sphinx build process) will give a cell 30 seconds to execute before it times out.

If you would like to change the amount of time given for a cell, you can change the timeout length for all notebooks by setting the following option in conf.py:

```python
nbsphinx_timeout = 60
```

Or change the timeout length on a per-notebook basis by adding this to the notebook’s JSON metadata:

```json
"nbsphinx": {
    "timeout": 60
},
```

The timeout is given in seconds, use -1 to disable the timeout.

Alternatively, you can manually execute the notebook in question and save the results, see the pre-executed example notebook (page 38).

**Note:**

It would make more sense to disable the timeout by default, but this problem has not yet been fixed in nbconvert, see https://github.com/jupyter/nbconvert/issues/791.

---

## Prolog and Epilog

When including notebooks in your Sphinx documentation, you can choose to add some generic content before and after each notebook. This can be done with the configuration values nbsphinx_prolog and nbsphinx_epilog in the file conf.py.

The prolog and epilog strings can hold arbitrary reST markup. Particularly, the only and raw directives can be used to have different content for HTML and LaTeX output.

Those strings are also processed by the Jinja templating engine. This means you can run Python-like code within those strings. You have access to the current Sphinx build environment via the variable env. Most notably, you can get the file name of the current notebook with

```python
{{ env.doc2path(env.docname, base=None) }}
```
Have a look at the Jinja2 template documentation\textsuperscript{151} for more information.

### Warning:

If you use invalid syntax, you might get an error like this:

```python
jinja2.exceptions.TemplateSyntaxError: expected token ':', got '{'}
```

This is especially prone to happen when using raw LaTeX, with its abundance of braces. To avoid clashing braces you can try to insert additional spaces or LaTeX macros that don’t have a visible effect, like e.g. \texttt{\strut{}}. For example, you can avoid three consecutive opening braces with something like that:

```latex
\texttt{\strut{}}\texttt{\{{ env.doc2path(env.docname, base=None) }}\texttt{\}}
```

NB: The three consecutive closing braces in this example are not problematic.

An alternative work-around would be to surround LaTeX braces with Jinja braces like this:

```jinja
{{ '{' }}
```

The string within will not be touched by Jinja.

Another special Jinja syntax is `{%`, which is also often used in fancy TeX/LaTeX code. A work-around for this situation would be to use

```jinja
{{ '{%' }}
```

### 8.1 Examples

You can include a simple static string, using \texttt{reST}\textsuperscript{152} markup if you like:

```bash
nbsphinx_epilog = ""
----
Generated by nbsphinx\_ from a Jupyter\_ notebook.
.. _nbsphinx: https://nbsphinx.readthedocs.io/
.. _Jupyter: https://jupyter.org/
""
```

Using some additional Jinja\texttt{2} markup and the information from the \texttt{env} variable, you can create URLs that point to the current notebook file, but located on some other server:

```jinja
nbsphinx_prolog = ""
Go there: https://example.org/notebooks/{{ env.doc2path(env.docname, base=None) }}
----
""
```

You can also use separate content for HTML and \texttt{LaTeX} output, e.g.:

```jinja
nbsphinx_prolog = r""
{% set docname = env.doc2path(env.docname, base=None) %}
.. only:: html

(continues on next page)
```

\textsuperscript{151} http://jinja.pocoo.org/docs/latest/templates/
\textsuperscript{152} https://www.sphinx-doc.org/rest.html
Note the use of the `\nbsphinxstartnotebook` and `\nbsphinxstopnotebook` commands. Those make sure there is not too much space between the “prolog” and the beginning of the notebook and, respectively, between the end of the notebook and the “epilog”. They also avoid page breaks, in order for the “prolog”/“epilog” not to end up on the page before/after the notebook.

For a more involved example for different HTML and LaTeX versions, see the file `conf.py` of the `nbsphinx` documentation.

---

9 Custom Notebook Formats

By default, Jupyter notebooks are stored in files with the suffix `.ipynb`, which use the JSON format for storage.

However, there are libraries available which allow storing notebooks in different formats, using different file suffixes.

To use a custom format in `nbsphinx`, you can specify the `nbsphinx_custom_formats` option in your `conf.py` file. You have to provide the file extension and a conversion function that takes the contents of a file (as a string) and returns a Jupyter notebook object.

```
\nbsphinx_custom_formats = {
    '.mysuffix': 'mylibrary.converter_function',
}
```

The converter function can be given as a string or as a function object.

One example for such library is `jupytext`\(^{153}\), which allows storing the contents of Jupyter notebooks in Markdown and R-Markdown, as well as plain Julia, Python and R files.

Since its conversion function takes more than a single string argument, just using the function name `jupytext.reads` will not work. We have to create a function object, and one way to do that is using a `lambda` function like this:

```
import jupytext

\nbsphinx_custom_formats = {
    '.Rmd': lambda s: jupytext.reads(s, '.Rmd'),
}
```

You can of course use multiple formats by specifying multiple conversion functions.

---

\(^{153}\) [https://github.com/mwouts/jupytext](https://github.com/mwouts/jupytext)
10 Notebooks in Sub-Directories

You can organize your notebooks in subdirectories and nbsphinx will take care that relative links to
other notebooks, images and other files still work.

Let’s see if links to local images work:

```
[1]: from IPython.display import Image
Image(filename='../images/notebook_icon.png')
```

Warning:
There may be problems with images in output cells if your source directory contains symbolic
links, see issue #49.

A link to a notebook in the same sub-directory: link (page 46).
A link to a notebook in the parent directory: link (page 18).
A link to a local file: link.
A random equation:

\[ F_n = F_{n-1} + F_{n-2} \]  \hspace{1cm} (08.15)

10.1 A Sub-Section

This is just for testing inter-notebook links, see this section (page 24).

11 Using toctree In A Notebook

In Sphinx-based documentation, there is typically a file called index.rst which contains one or more
toctree\(^{155}\) directives. Those can be used to pull in further source files (which themselves can contain
toctree directives).

\(^{154}\) https://github.com/spatialaudio/nbsphinx/issues/49
\(^{155}\) https://www.sphinx-doc.org/en/master/usage/restructuredtext/directives.html#directive-toctree
With nbsphinx it is possible to get a similar effect within a Jupyter notebook using the "nbsphinx-toctree" cell metadata. Markdown cells with "nbsphinx-toctree" metadata are not converted like “normal” Markdown cells. Instead, they are only scanned for links to other notebooks (or *.rst files and other Sphinx source files) and those links are added to a toctree directive. External links can also be used, but they will not be visible in the LaTeX output.

If there is a section title in the cell, it is used as toctree caption (but it also works without a title).

**Note:**
All other content of such a cell is ignored!

Use…

```
"nbsphinx-toctree": {}
```

… for the default settings, …

```
"nbsphinx-toctree": {
  "maxdepth": 2
}
```

… for setting the :maxdepth: option, or…

```
"nbsphinx-toctree": {
  "hidden": true
}
```

… for setting the :hidden: option.

Of course, multiple options can be used at the same time, e.g.

```
"nbsphinx-toctree": {
  "maxdepth": 3,
  "numbered": true
}
```

For more options, have a look at the Sphinx documentation[^1]. All options can be used – except :glob:, which can only be used in rst files (page 48) and in raw reST cells (page 37).

Note that in the HTML output, a toctree cell generates an in-line table of contents (containing links) at its position in the notebook, whereas in the LaTeX output, a new (sub-)section with the actual content is inserted at its position. All content below the toctree cell will appear after the table of contents/inserted section, respectively. If you want to use the LaTeX output, it is recommended that you don’t add further cells below a toctree cell, otherwise their content may appear at unexpected places. Multiple toctree cells in a row should be fine, though.

The following cell is tagged with "nbsphinx-toctree" metadata and contains a link to the notebook yet-another.ipynb (page 48) and an external link (which will only be visible in the HTML output). It also contains a section title which will be used as toctree caption (which also will only be visible in the HTML output).

156
11.1 Yet Another Notebook

This notebook is only here to show how (sub-)toctrees can be created with Markdown cell metadata. See there (page 46).

12 Normal reStructuredText Files

This is a normal RST file.

**Note:** Those still work!

12.1 Links to Notebooks (and Other Sphinx Source Files)

Links to Sphinx source files can be created like normal Sphinx hyperlinks, just using a relative path to the local file: link (page 46).

```rst
using a relative path to the local file: link_.
.. _link: subdir/a-notebook-in-a-subdir.ipynb
```

If the link text has a space (or some other strange character) in it, you have to surround it with backticks: a notebook link (page 46).

```rst
surround it with backticks: `a notebook link`_.
.. _a notebook link: subdir/a-notebook-in-a-subdir.ipynb
```

You can also use an anonymous hyperlink target, like this: link (page 46). If you have multiple of those, their order matters!

```rst
like this: link_.
__ subdir/a-notebook-in-a-subdir.ipynb
```

Finally, you can use Embedded URIs, like this link (page 46).

```rst
like this `link <subdir/a-notebook-in-a-subdir.ipynb>`_.
```

**Note:** These links should also work on Github and in other rendered reStructuredText pages.

Links to subsections are also possible by adding a hash sign (#) and the section title to any of the above-mentioned link variants. You have to replace spaces in the section titles by hyphens. For example, see this subsection (page 46).

```rst
For example, see this subsection_.
.. _subsection: subdir/a-notebook-in-a-subdir.ipynb#A-Sub-Section
```

---

158 http://docutils.sourceforge.net/docs/ref/rst/restructuredtext.html#anonymous-hyperlinks
159 http://docutils.sourceforge.net/docs/ref/rst/restructuredtext.html#embedded-uris-and-aliases
12.2 Links to Notebooks, Ye Olde Way

In addition to the way shown above, you can also create links to notebooks (and other Sphinx source files) with `:ref:`. This has some disadvantages:

- It is arguably a bit more clunky.
- Because `:ref:` is a Sphinx feature, the links don’t work on Github and other rendered reStructuredText pages that use plain old `docutils`.

It also has one important advantage:

- The link text can automatically be taken from the actual section title.

A link with automatic title looks like this: *Notebooks in Sub-Directories* (page 46).

```plaintext
:ref:`/subdir/a-notebook-in-a-subdir.ipynb`
```

But you can also provide your own link title (page 46).

```plaintext
:ref:`your own link title </subdir/a-notebook-in-a-subdir.ipynb>`
```

However, if you want to use your own title, you are probably better off using the method described above in *Links to Notebooks (and Other Sphinx Source Files)* (page 48).

Links to subsections are also possible, e.g. *A Sub-Section* (page 46) (the subsection title is used as link text) and *alternative text* (page 46).

These links were created with:

```plaintext
:ref:`/subdir/a-notebook-in-a-subdir.ipynb#A-Sub-Section`
:ref:`alternative text </subdir/a-notebook-in-a-subdir.ipynb#A-Sub-Section>`
```

Note:

- The paths have to be relative to the top source directory and they have to start with a slash (`/`).
- Spaces in the section title have to be replaced by hyphens!

12.3 Sphinx Directives for Info/Warning Boxes

**Warning:**

This is an experimental feature! Its usage may change in the future or it might disappear completely, so don’t use it for now.

With a bit of luck, it will be possible (some time in the future) to create info/warning boxes in Markdown cells, see [https://github.com/jupyter/notebook/issues/1292](https://github.com/jupyter/notebook/issues/1292). If this ever happens, `nbsphinx` will provide directives for creating such boxes. For now, there are two directives available: `nbinfo` and `nbwarning`. This is how an info box looks like:

Note:

This is an info box.

It may include nested formatting, even another info/warning box:

`https://www.sphinx-doc.org/en/master/usage/restructuredtext/roles.html#role-ref`
12.4 Domain Objects

\texttt{example\_python\_function}(\texttt{foo})

This is just for testing domain object links. See \textit{this section} (page 25).

\textbf{Parameters} \texttt{foo (str)} – Example string parameter

12.5 Citations

You could use standard Sphinx citations\textsuperscript{161}, but it might be more practical to use the \texttt{sphinxcontrib.bibtex}\textsuperscript{162} extension.

If you install and enable this extension, you can create citations like \cite{PGH11}:

\begin{verbatim}
\cite{perez2011python}
\end{verbatim}

You can create similar citations in Jupyter notebooks with a special HTML syntax, see the section about citations in \textit{Markdown cells} (page 20).

For those citations to work, you also need to specify a BibTeX file, as explained in the next section.

12.6 References

After installing and \textit{enabling} (page 9) the \texttt{sphinxcontrib.bibtex}\textsuperscript{163} extension, you can create a list of references from a BibTeX file like this:

\begin{verbatim}
.. bibliography:: references.bib
\end{verbatim}

Have a look at the documentation for all the available options.

The list of references may look something like this (in HTML output):

However, in the LaTeX/PDF output the list of references will not appear here, but at the end of the document. For a possible work-around, see \url{https://github.com/mcmstroffas/sphinxcontrib-bibtex/issues/156}.

There is an alternative Sphinx extension for creating bibliographies: \url{https://bitbucket.org/wnielson/sphinx-natbib/}. However, this project seems to be abandoned (last commit in 2011).

The following section was generated from \texttt{doc/links.ipynb} …………………………………………………………………………………………………………………….

13 External Links

\texttt{nbconvert}

The official conversion tool of the Jupyter project. It can be used to convert notebooks to HTML, LaTeX and many other formats.

Its \texttt{--execute} flag can be used to automatically execute notebooks before conversion.

\textsuperscript{161} https://www.sphinx-doc.org/en/master/usage/restructuredtext/basics.html#citations
\textsuperscript{162} https://sphinxcontrib-bibtex.readthedocs.io/
\textsuperscript{163} https://sphinxcontrib-bibtex.readthedocs.io/
RunNotebook (notebook_sphinxext.py)

Notebooks can be included in *.rst files with a custom notebook directive. Uses nbconvert to execute notebooks and to convert the result to HTML.

No LaTeX support.

https://github.com/ngoldbaum/RunNotebook

There are some forks:

- https://bitbucket.org/yt_analysis/yt-doc/src/default/extensions/notebook_sphinxext.py

nbsite

Build a tested, sphinx-based website from notebooks.

https://nbsite.pyviz.org/

ipypublish

A workflow for creating and editing publication ready scientific reports and presentations, from one or more Jupyter Notebooks, without leaving the browser!

https://ipypublish.readthedocs.io/
https://github.com/chrisjsewell/ipypublish

jupyter-book

Create an online book with Jupyter Notebooks and Jekyll

https://jupyter.org/jupyter-book
https://github.com/jupyter/jupyter-book

nbinteract

Create interactive webpages from Jupyter Notebooks

https://www.nbinteract.com/
https://github.com/SamLau95/nbinteract

nb_pdf_template

An extended nbconvert template for LaTeX output.

https://github.com/t-makaro/nb_pdf_template

nb2plots

Notebook to reStructuredText converter which uses a modified version of the matplotlib plot directive.

https://github.com/matthew-brett/nb2plots

brole

A Sphinx role for IPython notebooks

https://github.com/matthew-brett/brole

Sphinx-Gallery

14 Contributing

If you find bugs, errors, omissions or other things that need improvement, please create an issue or a pull request at http://github.com/spatialaudio/nbsphinx/. Contributions are always welcome!

Instead of pip-installing the latest release from PyPI\(^{166}\), you should get the newest development version (a.k.a. “master”) from Github\(^{167}\):

```
git clone https://github.com/spatialaudio/nbsphinx.git
cd nbsphinx
python3 -m pip install -e . --user
```

This way, your installation always stays up-to-date, even if you pull new changes from the Github repository. If you have only Python 3 installed, you might have to use the command `python` instead of `python3`. When installing `nbsphinx` this way, you can also quickly check other Git branches (in this example the branch is called “another-branch”):

```
git checkout another-branch
```

When you run Sphinx now, it automatically uses the version “another-branch” of `nbsphinx`. If you want to go back to the “master” branch, use:

```
git checkout master
```

To get the latest changes from Github, use:

```
git pull --ff-only
```

If you make changes to the documentation, you should create the HTML pages locally using Sphinx and check if they look OK:

```
python3 setup.py build_sphinx
```

To check the LaTeX output, use:

```
python3 setup.py build_sphinx -b latex
```

Again, you’ll probably have to use `python` instead of `python3`. The generated files will be available in the directories `build/sphinx/html/` and `build/sphinx/latex/`, respectively.

15 Version History

Version 0.5.1 (2020-01-28):

- This will be the last release supporting Python 2.x!
- Support for https://github.com/choldgraf/sphinx-copybutton
- Executed notebooks are now saved in the HTML output directory

Version 0.5.0 (2019-11-20):

- Automatic support for Jupyter widgets, customizable with `nbsphinx_widgets_path` (and `nbsphinx_widgets_options`)

Version 0.4.3 (2019-09-30):

\(^{166}\) https://pypi.org/project/nbsphinx/
\(^{167}\) https://github.com/spatialaudio/nbsphinx/
• Add option `nbsphinx_requirejs_path` (and `nbsphinx_requirejs_options`)

Version 0.4.2 (2019-01-15):
• Re-establish Python 2 compatibility (but the clock is ticking …)

Version 0.4.1 (2018-12-16):
• Fix issue #266

Version 0.4.0 (2018-12-14):
• Support for “data-cite” HTML tags in Markdown cells
• Add option `nbsphinx_custom_formats`
• LaTeX macros `\nbsphinxstartnotebook` and `\nbsphinxstopnotebook`
• Support for cell attachments
• Add options `nbsphinx_input_prompt` and `nbsphinx_output_prompt`
• Re-design LaTeX output of code cells, fix image sizes

Version 0.3.5 (2018-09-10):
• Disable `nbconvert` version 5.4 to avoid issue #878

Version 0.3.4 (2018-07-28):
• Fix issue #196 and other minor changes

Version 0.3.3 (2018-04-25):
• Locally linked files are only copied for Jupyter notebooks (and not anymore for other Sphinx source files)

Version 0.3.2 (2018-03-28):
• Links to local files are rewritten for all Sphinx source files (not only Jupyter notebooks)

Version 0.3.1 (2018-01-17):
• Enable notebook translations (NB: The use of reST strings is temporary!)

Version 0.3.0 (2018-01-02):
• Add options `nbsphinx_prolog` and `nbsphinx_epilog`
• Links from `*.rst` files to notebooks have to start with a slash

Version 0.2.18 (2017-12-03):
• Fix issue #148

Version 0.2.17 (2017-11-12):
• Fix issue #146

Version 0.2.16 (2017-11-07):
• Fix issue #142

Version 0.2.15 (2017-11-03):
• Links to subsections are now possible in all source files

Version 0.2.14 (2017-06-09):
• Add option `nbsphinx_kernel_name`

Version 0.2.13 (2017-01-25):

---

168 https://github.com/jupyter/nbconvert/issues/878
• Minor fixes

Version 0.2.12 (2016-12-19):
• Basic support for widgets
• CSS is now “responsive”, some new CSS classes

Version 0.2.11 (2016-11-19):
• Minor fixes

Version 0.2.10 (2016-10-16):
• Enable JavaScript output cells

Version 0.2.9 (2016-07-26):
• Add option nbsphinx_prompt_width

Version 0.2.8 (2016-05-20):
• Add options nbsphinx_execute and nbsphinx_execute_arguments
• Separate “display priority” for HTML and LaTeX

Version 0.2.7 (2016-05-04):
• Special CSS tuning for sphinx_rtd_theme
• Replace info/warning <div> elements with nbinfo/nbwarning

Version 0.2.6 (2016-04-12):
• Support for LaTeX math environments in Markdown cells
• Add options nbsphinx_timeout and nbsphinx_codecell_lexer

Version 0.2.5 (2016-03-15):
• Add option nbsphinx_allow_errors to globally ignore exceptions
• Separate class nbsphinx.Exporter

Version 0.2.4 (2016-02-12):
• Support for “nbsphinx-toctree” cell metadata

Version 0.2.3 (2016-01-22):
• Links from notebooks to local files can now be used

Version 0.2.2 (2016-01-06):
• Support for links to sub-sections in other notebooks

Version 0.2.1 (2016-01-04):
• No need to mention source_suffix and source_parsers in conf.py

Version 0.2.0 (2015-12-27):
• Add support for allow_errors and hidden metadata
• Add custom reST template
• Add nbinput and nboutput directives with HTML+CSS and LaTeX formatting
• Turn nbsphinx into a Sphinx extension

Version 0.1.0 (2015-11-29): Initial release
